Ronald Gillam, PhD holds the Raymond and Eloise Lillywhite Endowed Chair in Speech-Language Pathology at Utah State University, where he is also the Co-Director of the Interdisciplinary Doctoral Program in Neuroscience. His research, which has been funded by the National Institutes of Health and the U.S. Department of Education, primarily concerns information processing, language assessment, and language intervention with school-age children with language disorders. Dr. Gillam has published three books, three norm-referenced tests, and more than 130 book chapters. He has been an associate editor of the Journal of Speech, Language, and Hearing Research, the American Journal of...

Transcript of Clinical Evaluation of Language Fundamentals - 4th Edition. Purpose of Test Determine the presence of a language disorder or delay, then describe its nature, underlying clinical behaviors, and impact on academic achievement. Pearson claims that it takes between 30 and 60 minutes to administer the CELF-4. Each testing kit comes with the following components: Examiner’s Manual, Derbyshire picture test, Clinical Evaluation of Language Fundamentals (CELF-4), Assesses receptive, expressive, and pragmatic language. Clinical Evaluation of Language Fundamentals: Pre-School (CELF-P), Assesses receptive, expressive, and pragmatic language skills in Pre-School aged children. Assessment of Comprehension and Expression 6-11 (ACE 6-11), a battery of receptive, expressive and pragmatic language tests. RAPT - picture naming and grammar/content analysis. RWFVS - Picture naming/vocabulary test. The assessment of a child’s language during the preschool years can be complex, not only due to variability in skill development, but also because of the differences between school and early childhood service criteria. By choosing an appropriate assessment battery based on strengths of the instrument, an SLP is often able to overcome the issue of qualifying children with different functional communication levels. The Core Language Score is the most reliable and sensitive indicator of the presence of a language disorder. When the Core Language Score is low, it seems prudent to administer all the standardized subtests of CELF-4 to identify potential patterns of strengths and weaknesses.
